

# Estimating Foreign-Born Emigration Using Longitudinal Tax and Social Security Data

Thomas B. Foster, Anthony Knapp, and Erik Vickstrom

*U.S. Census Bureau*

October 26, 2022

# Background

- Estimating emigration is challenging because of limited data.
- Previous Sources:
  - Immigration and Naturalization Service, 1908 to 1957.
  - Alien Address Report Program, 1952 to 1981.
- Contemporary Sources:
  - U.S. Customs and Border Protection (CBP) Form I-94 Arrival/Departures.
  - Social Security Administration (SSA) files.

# Background

- Lacking data directly detecting emigration, “residual” methods aim to estimate emigration indirectly.
- Warren and Peck (1980) developed a Census-Census residual method to derive foreign-born emigration from population change measured between two decennial censuses.
- Ahmed and Robinson (1994) and Mulder et al. (2003) updated the rates after each census.
- Leach and Jensen (2013) replaced census data with the American Community Survey (ACS).

# Selected Foreign-Born Emigration Rates from Prior Research

**Generally, 1 to 1.5 out of every 100 foreign born emigrate per year over the long run.**

# Motivation

- Population Estimates Program (PEP) uses ACS data to estimate foreign-born emigration.
  - Estimates derived from ACS inputs are lagged, not year-specific, and can be unstable.
  - Coverage and non-coverage errors create uncertainty in the estimates.
- Ongoing work to leverage existing administrative data at the Census Bureau to evaluate ACS-based rates.
  - Better leverage the longitudinal nature of tax data, implementing and evaluating a “signs-of-life” approach.
  - Increase coverage of foreign-born non-filers with IRS 1099 or “information returns”.

# Data

- IRS 1040 federal tax returns and IRS 1099 “information returns” (W2s, 1098s, 1099s)
  - Tax Years 2009 through 2020
- Numident file (2022)
- Link these individual records using Protected Identification Keys (PIKs)
- Comparison data based on 2020 PEP methodology: <sup>1</sup>
  - Simulated emigration rates from ACS-ACS residual method
  - Characteristics come from ACS proxy universe method

Data Set	Variables	Universe
IRS 1040s	<ul style="list-style-type: none"> <li>• Geography</li> <li>• Tax Year</li> <li>• ITIN Flag</li> </ul>	<ul style="list-style-type: none"> <li>• Filers in U.S. <i>or abroad</i></li> </ul>
IRS 1099s	<ul style="list-style-type: none"> <li>• Geography</li> <li>• Tax Year</li> </ul>	<ul style="list-style-type: none"> <li>• Filers and Non-Filers in U.S.</li> </ul>
Numident	<ul style="list-style-type: none"> <li>• Date of Birth</li> <li>• Date of Death</li> <li>• Country of Birth</li> <li>• Year Social Security Number (SSN) Issued</li> <li>• Foreign-Born Flag</li> </ul>	<ul style="list-style-type: none"> <li>• Individuals ever issued an SSN</li> </ul>

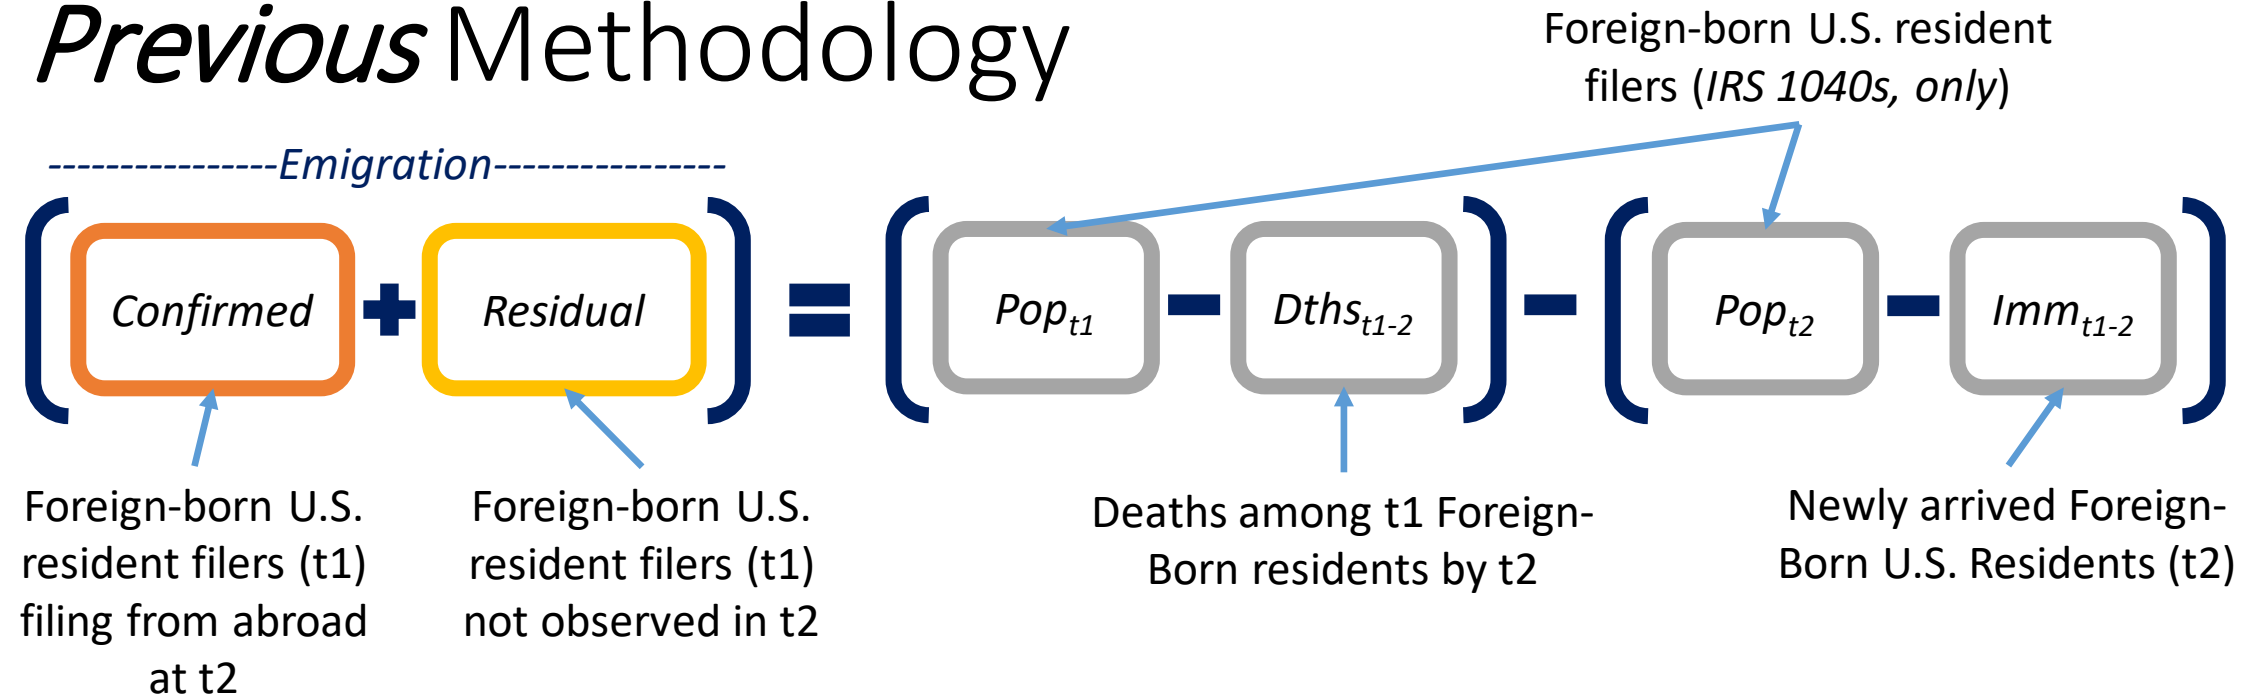

<sup>1</sup> PEP methodology: <https://www.census.gov/programs-surveys/popest/technical-documentation/methodology.html>

# Coverage Improvements & ITIN Issues

Coverage	Previously (1040s Only)	Currently (1040s and 1099s)
Best	Permanent immigrants, naturalized citizens, non-citizen workers, refugees	Permanent immigrants, naturalized citizens, non-citizen workers, refugees
Limited	Non-citizen students, non-citizen spouses and children	Non-citizen students, non-citizen spouses and children, <b><i>non-filers, inconsistent filers</i></b>
Worst	Undocumented/unauthorized migrations, asylum seekers	Undocumented/unauthorized migrations, asylum seekers
None	<b><i>Non-filers, inconsistent filers</i></b> , Non-SSNs (ITINs)	Non-SSNs (ITINs)

- While we do observe ITINs in the IRS 1040s and 1099s (15% of the resident foreign-born population, on average), unresolved issues stemming from PIK assignment remain.
  - Cannot distinguish an *ITIN* → *residual emigrant* from an *ITIN* → *SSN non-emigrant*.

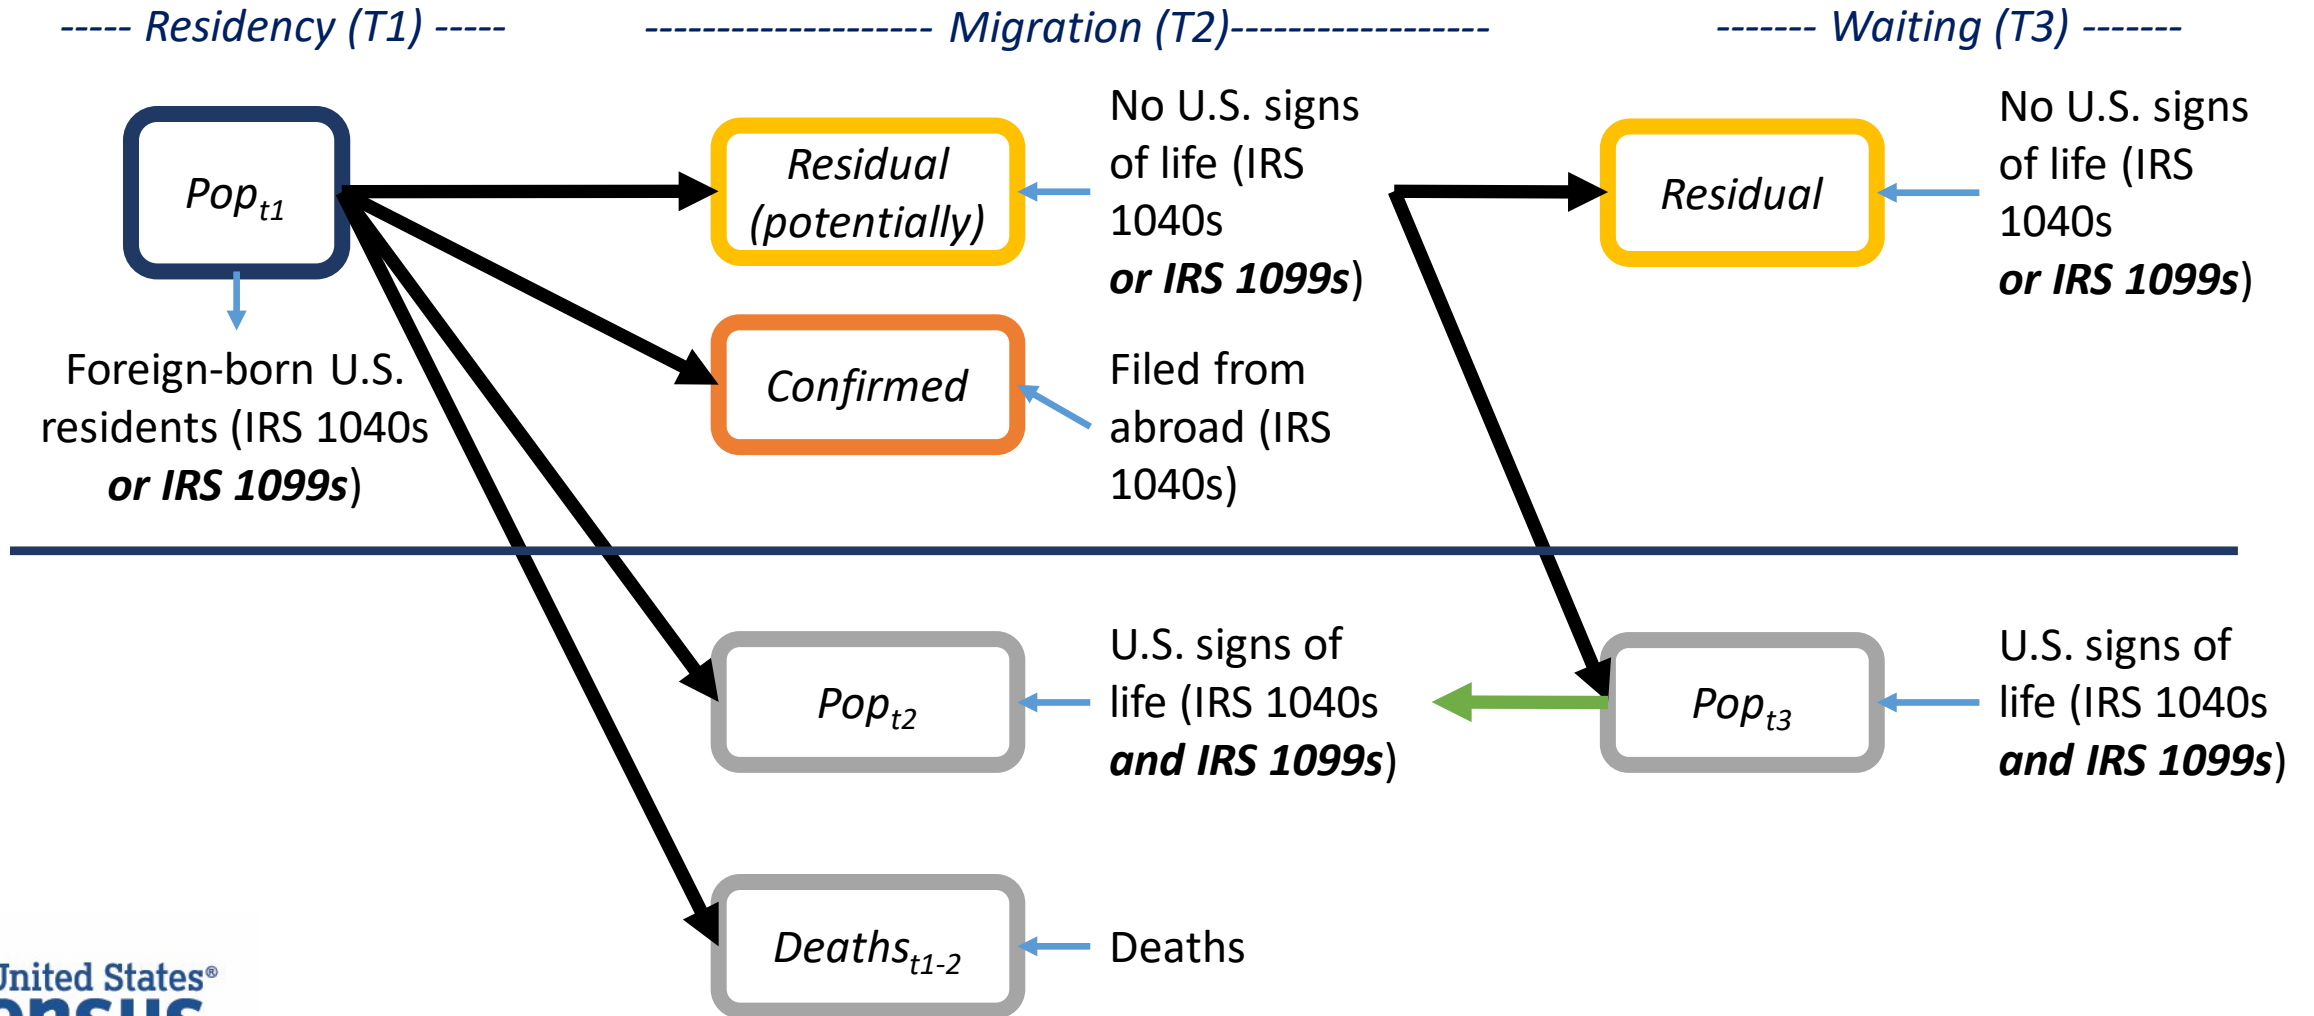

# Previous Methodology

- Stable confirmed emigrant component, but erratic residual.
- Residual component includes non-emigrants who simply do not file in t2 (retirees, low earners, etc.)
- Requires accurate estimation of population stock and immigration component in t2.

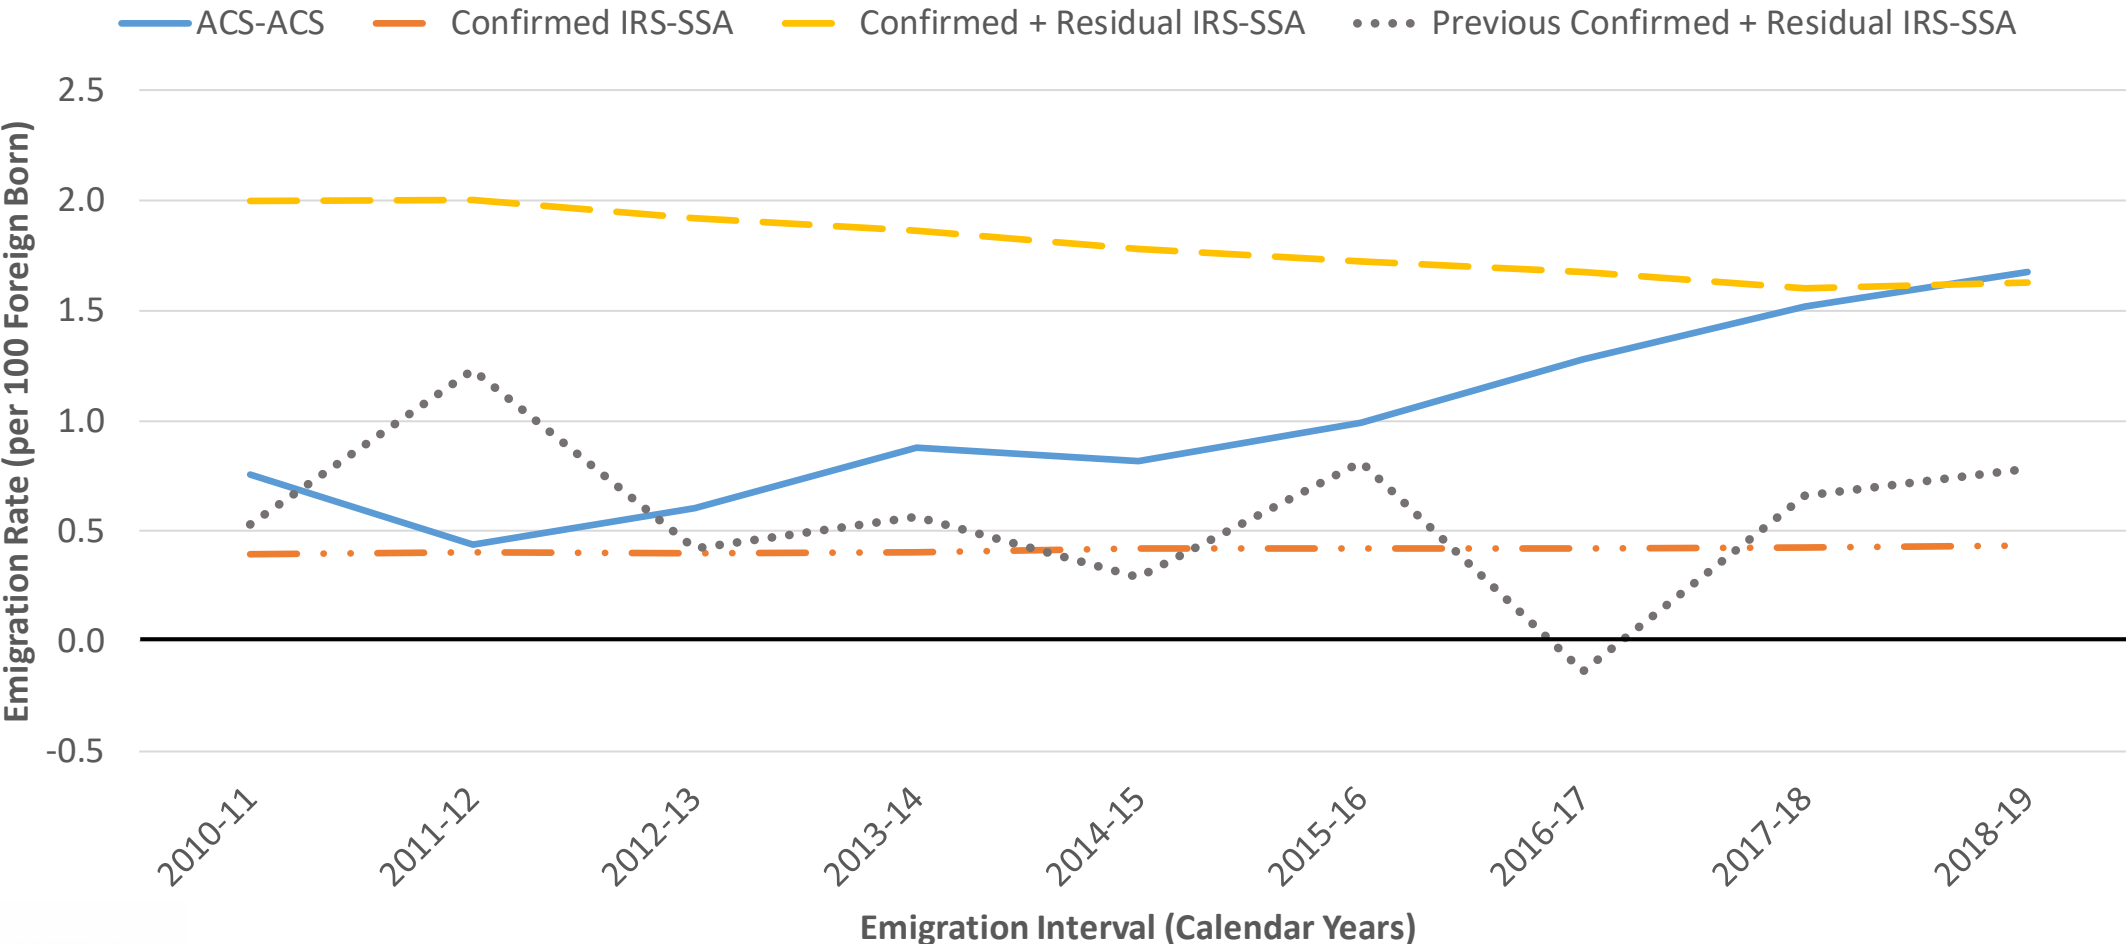

# Current Methodology

# Emigration Rates

# Emigration Rates (with Previous Estimates)

Source: ACS-ACS unadjusted residual estimates; Linked IRS 1040/1099 (TYs 2009-2020) and Numident (2022). DRB Approval Numbers: CBDRB-FY2022-CES010-011 & CBDRB-FY2022-CES010-028.

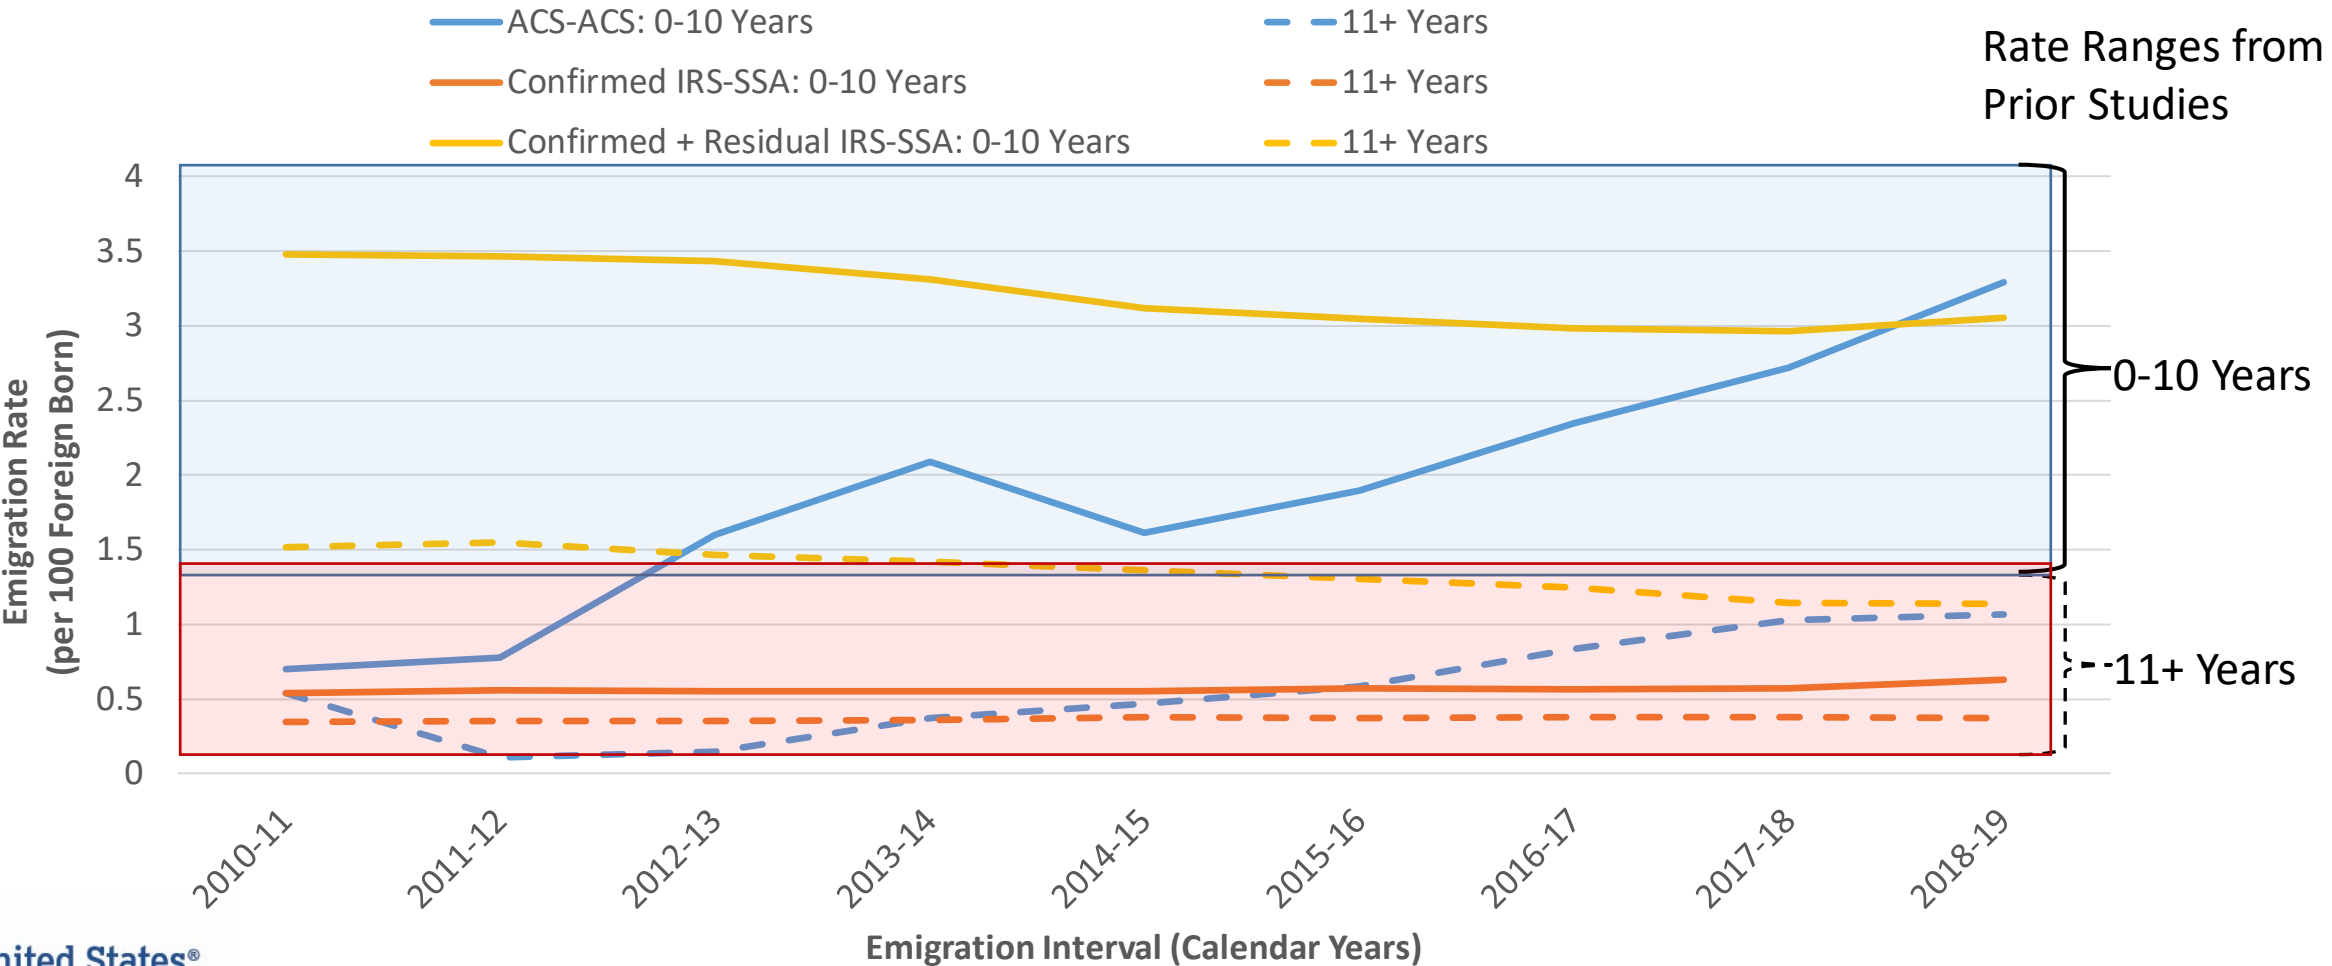

# Emigration Rates by Years of Residence in U.S.

- Most prior research finds that emigration rates decrease as years of residence in the U.S. increase:
  - Those residing in the U.S. for 10 years or fewer emigrate at rates between 1.3 and 4.4 percent.
  - More established foreign-born residents (11+ years) emigrate at rates between 0.2 and 1.4 percent.

Prior Studies	Years of Residence in U.S.		
	0-10 Years	11+ Years	Total
Warren & Peck (1980)	4.4	-	1.2
Schwabish (2011)	2.3	-	1.3
Mulder et al. (2003)	0.3	1.4	0.9
Scopilliti (2011)	1.4	0.4	-
Leach & Jensen (2013)	1.3	0.2	0.6

Note: Rates per 100 foreign-born individuals.

# Emigration Rates by Years of Residence in U.S.

Source: ACS-ACS unadjusted residual estimates; Linked IRS 1040/1099 (TYs 2009-2020) and Numident (2022). DRB Approval Numbers: CBDRB-FY2022-CES010-011 & CBDRB-FY2022-CES010-028.

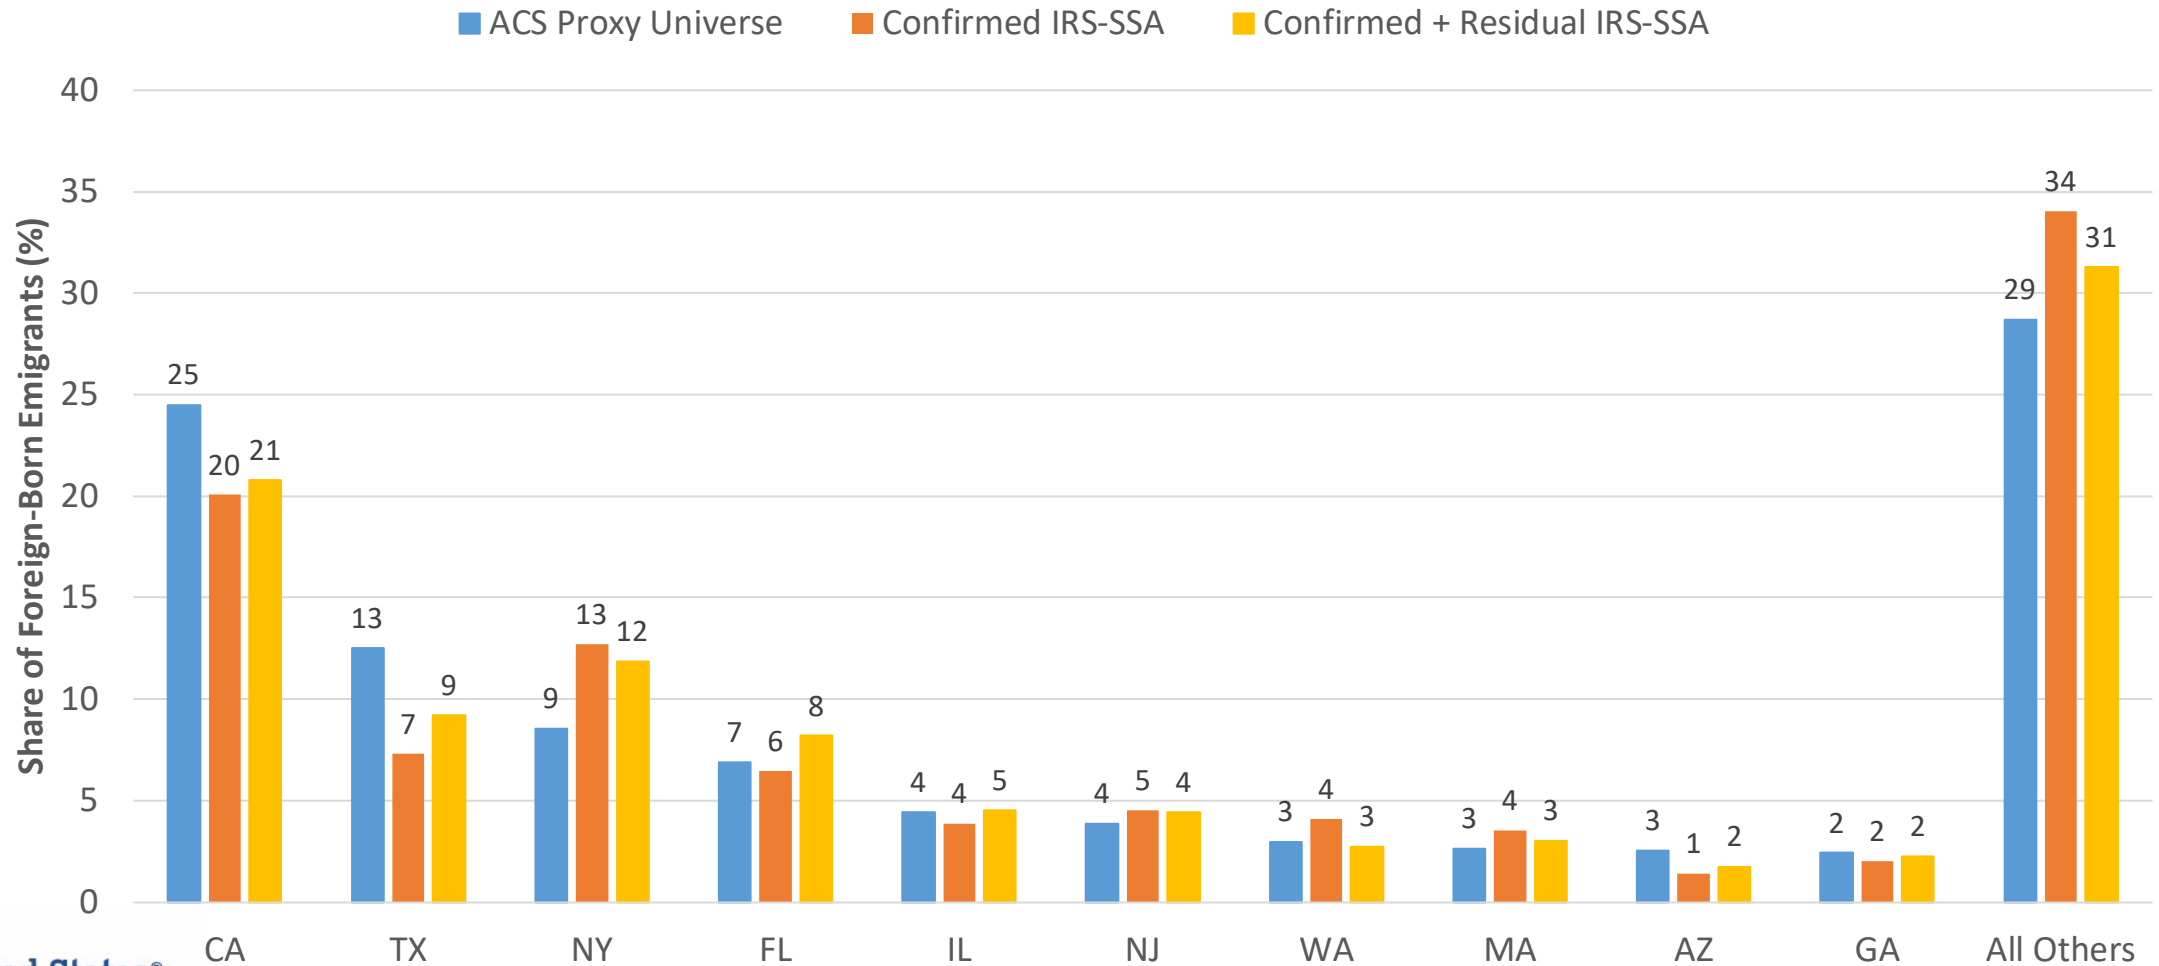

# Foreign-Born Emigrants by Age: 2018-2019

# Foreign-Born Emigrants by Birthplace: 2018-2019

# Foreign-Born Emigrants by State: 2018-2019

# Discussion

- IRS and SSA data are not designed to measure emigration, but results show promise
- Improvements to previous method increase coverage and reduce false positives in the residual component
  - “Signs-of-Life” methods take advantage of the longitudinal nature of the data
  - Inclusion of IRS information returns capture non-filers and inconsistent filers
- However, clear signs of selection bias remain
  - IRS-SSA distribution of emigrants skews older than ACS residual estimates
  - IRS-SSA data undercount emigrants born in Mexico and leaving CA and TX
- And, declining emigration may reflect increasing coverage of tax data

# Next Steps

- Explore methods to adjust for increasing coverage of the foreign-born population by tax data
- Potentially incorporate additional administrative data
  - Composite address or residential history files
  - Medicare beneficiary data
  - Kid link files
- Explore methods for incorporating the ITIN population into these estimates
  - Mexico-born population overrepresented among those in the tax data with ITINs?

# Thank you!
